Strategic Product Placement Analysis Using Data Visualization

Github: https://github.com/ADITYAKIRAN890/strategic-product-placement-analysis

1. Introduction

Retail stores rely heavily on strategic product placement to maximize sales and improve customer experience. The location of a product inside the store, such as the aisle, front of store, or end-cap, can significantly influence consumer purchasing behavior.

The purpose of this project is to analyze how product placement, consumer demographics, pricing, and promotional strategies affect sales performance. By analyzing retail data and visualizing it through dashboards, businesses can make better decisions about where to place products inside stores to increase revenue.

This project uses Tableau for data visualization and Flask for building a web interface that displays interactive dashboards and stories.

2. Problem Statement

Retail stores often struggle to determine the most effective product placement strategy that maximizes sales while maintaining optimal store layout.

The key problem addressed in this project is:

How do product positioning, pricing, and customer demographics influence product sales in retail stores?

Understanding this relationship will help businesses:

- Improve product placement strategies
- Increase product visibility
- Optimize pricing strategies
- Increase overall sales performance

3. Objectives of the Project

The main objectives of this project are:

1. To analyze the relationship between product placement and sales volume
2. To understand how consumer demographics influence purchasing behavior
3. To compare competitor pricing with store pricing

4. To evaluate the impact of promotions on product sales
5. To develop interactive data dashboards and visual stories for business insights
6. To integrate the analytics dashboard into a Flask-based web application

4. Data Collection

The dataset used in this project was obtained from Kaggle, a well-known platform for public datasets.

Dataset Source:
https://www.kaggle.com/datasets/amitvkulkarni/impact-of-product-positioning-on-sales

The dataset contains retail sales information including:

- Product category
- Product position in store
- Sales volume
- Price
- Competitor price
- Consumer demographics
- Promotion status
- Seasonal demand
- Foot traffic

This dataset helps analyze how different retail factors influence product sales.

5. Data Description

The dataset contains several important variables used for analysis.

Column Name	Description
Product Category	Category of product (Clothing, Electronics, Food)
Product Position	Placement location (Aisle, End-cap, Front of Store)
Price	Price of product in store

Column Name	Description
Competitor Price	Price of the same product at competitor store
Sales Volume	Number of units sold
Promotion	Whether promotion was applied
Consumer Demographics	Customer group (Families, Seniors, Young Adults, Students)
Seasonality	Seasonal demand factor
Foot Traffic	Customer traffic in store

6. Data Cleaning and Preparation

Before visualization, the dataset was cleaned and prepared for analysis.

The following steps were performed:

1. Handling Missing Values

The dataset was inspected to identify missing or incomplete values. Missing values were either removed or replaced with appropriate values.

2. Data Formatting

Columns such as Price and Sales Volume were converted into numerical formats to allow accurate calculations.

3. Categorization

Categorical variables such as:

- Product Position
- Product Category
- Consumer Demographics

were organized properly for easier visualization.

4. Data Validation

The dataset was checked for duplicate records and inconsistent entries to ensure data accuracy.

After cleaning, the dataset was ready for visualization.

7. Data Visualization Using Tableau

To analyze the dataset effectively, several visualizations were created using Tableau.

These visualizations were later combined into a dashboard for interactive exploration.

Visualizations Created

1. **Average Sales Volume vs Product Category**
    - Shows which category sells the most.
2. **Consumer Demographics vs Sales Volume**
    - Displays which customer groups purchase the most.
3. **Promotion vs Product Category**
    - Shows the impact of promotions on product sales.
4. **Foot Traffic vs Average Sales Volume**
    - Demonstrates how store traffic influences sales.
5. **Competitor Price vs Product Price**
    - Helps analyze pricing strategy against competitors.
6. **Product Category vs Price Distribution**
    - Shows price comparison across categories.
7. **Product Placement vs Sales Volume**
    - Evaluates the impact of location inside store.

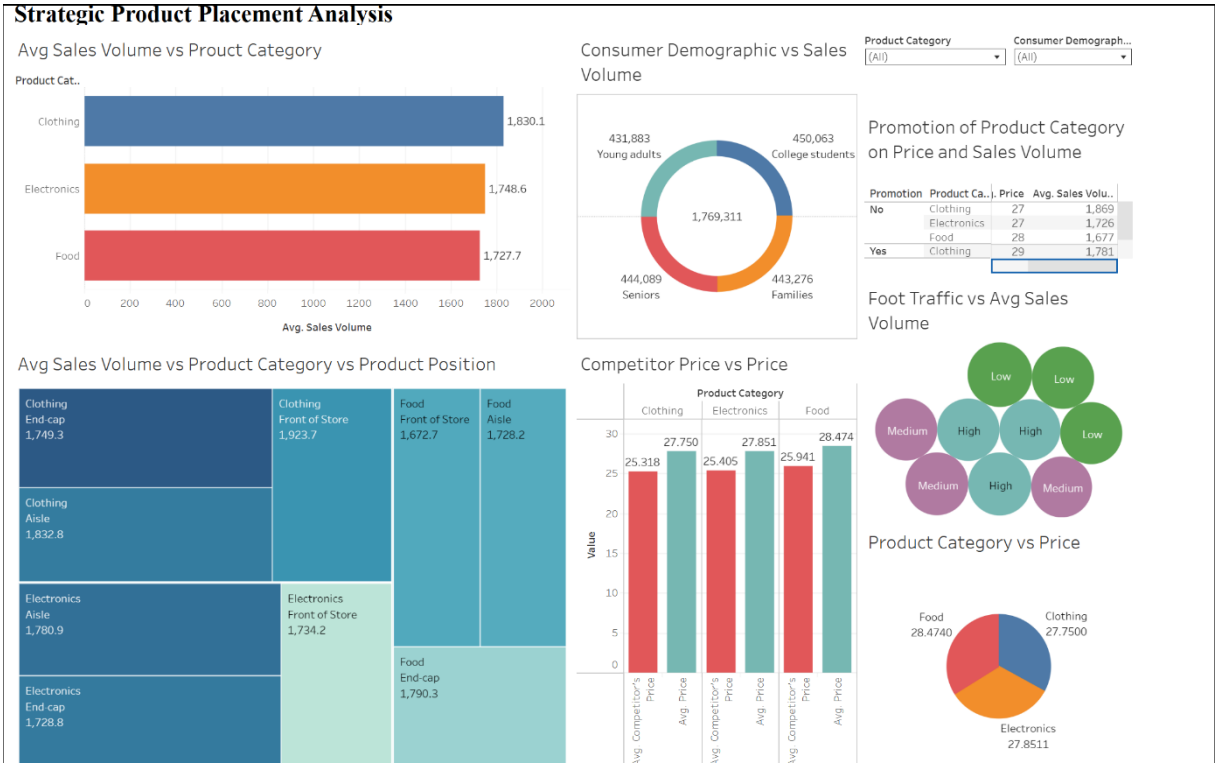
8. Dashboard Development

A Tableau Dashboard was created by combining multiple visualizations into one interface.

The dashboard allows users to:

- Filter by product category
- Filter by consumer demographics
- Analyze sales trends
- Compare pricing and promotions
- Understand product placement performance

The dashboard provides a comprehensive view of sales insights.



9. Story Creation in Tableau

To present insights clearly, a Tableau Story was developed.

The story explains the findings step by step.

Story Points

Story Point 1: Product Category vs Average Sales Volume

The first story point analyzes the average sales volume across different product categories.

The categories analyzed are:

- Clothing
- Electronics
- Food

From the bar chart visualization, the following observations were made:

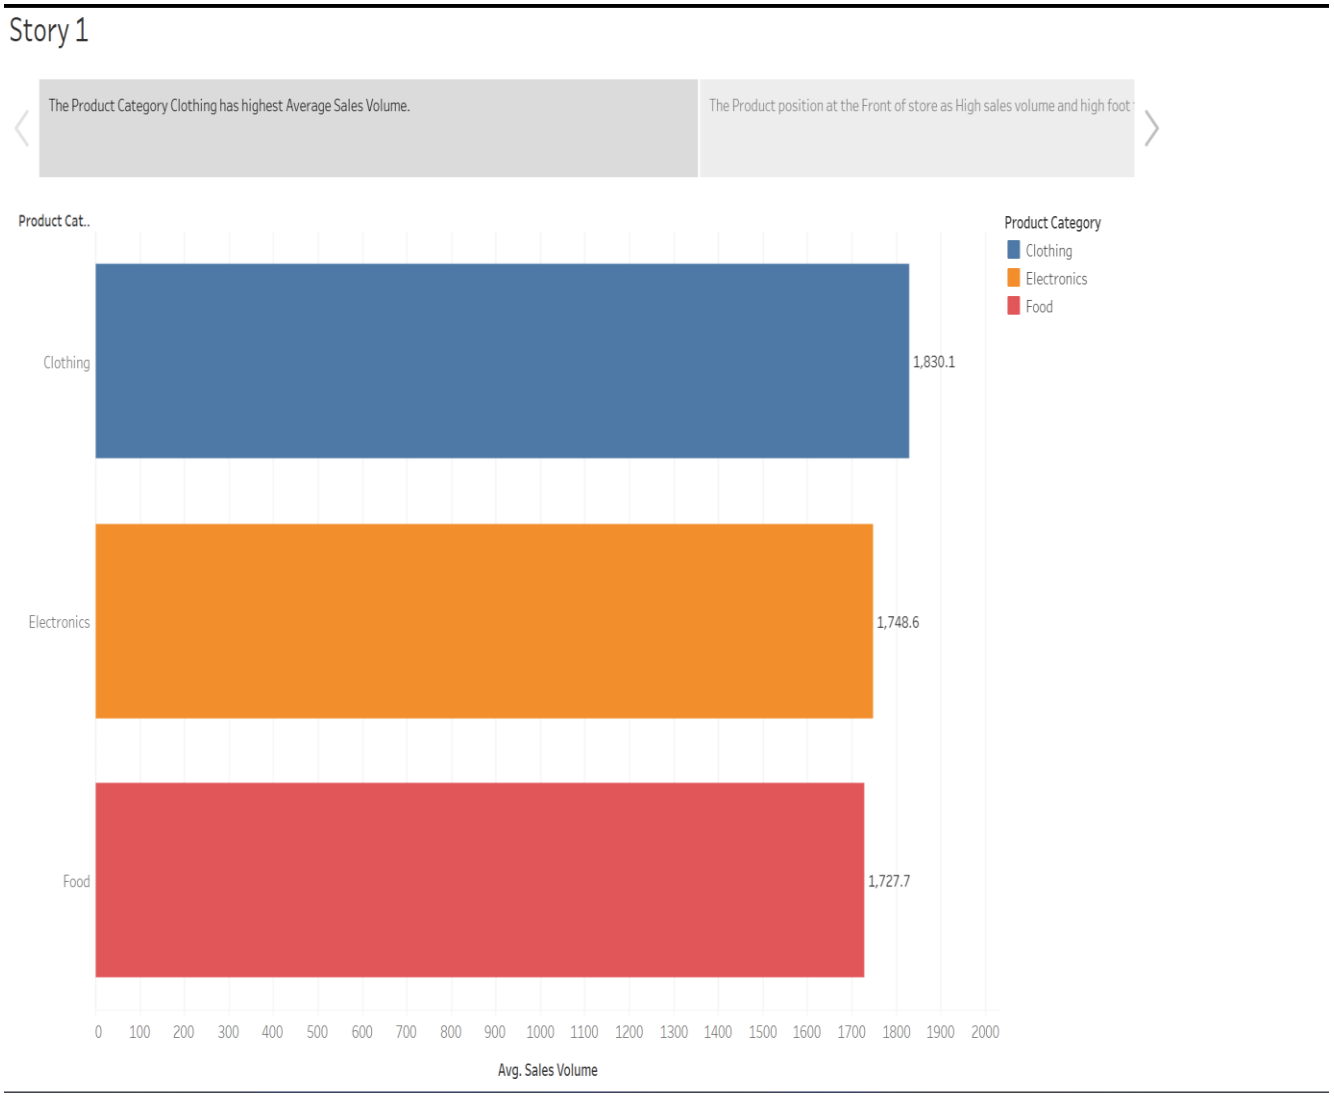
- Clothing products recorded the highest average sales volume of 1830.1.
- Electronics products recorded an average sales volume of 1748.6.
- Food products recorded the lowest average sales volume of 1727.7.

This indicates that clothing products are the most profitable category in terms of sales performance.

Retailers can use this insight to:

- Allocate more shelf space for clothing products

- Place clothing items in highly visible store locations
- Focus marketing strategies on high-performing categories



Story Point 2: Product Position vs Sales Volume and Foot Traffic

The second story point examines how product placement and store foot traffic affect sales volume.

The visualization shows different product positions:

- Aisle
- End-cap

- Front of Store

Along with different foot traffic levels:

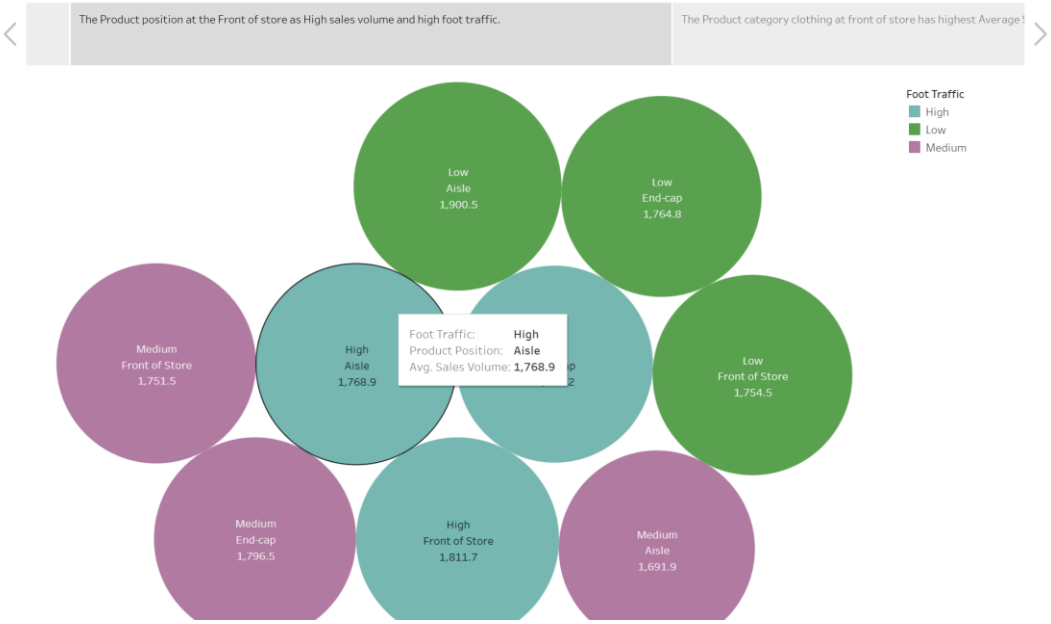
- High
- Medium
- Low

The analysis reveals:

- Products placed in high foot traffic areas generate higher sales.
- Front of Store placement with high traffic produced one of the highest sales volumes (1811.7).
- Aisle placement also shows strong performance with sales around 1900.5 in low traffic conditions, indicating product demand also affects results.

This demonstrates that store layout and customer movement patterns influence purchasing behavior.

Retailers should strategically place popular products in high traffic zones to maximize visibility and sales.



Story Point 3: Product Placement Impact on Sales (Treemap Analysis)

The third story point visualizes the relationship between product category and store placement using a treemap chart.

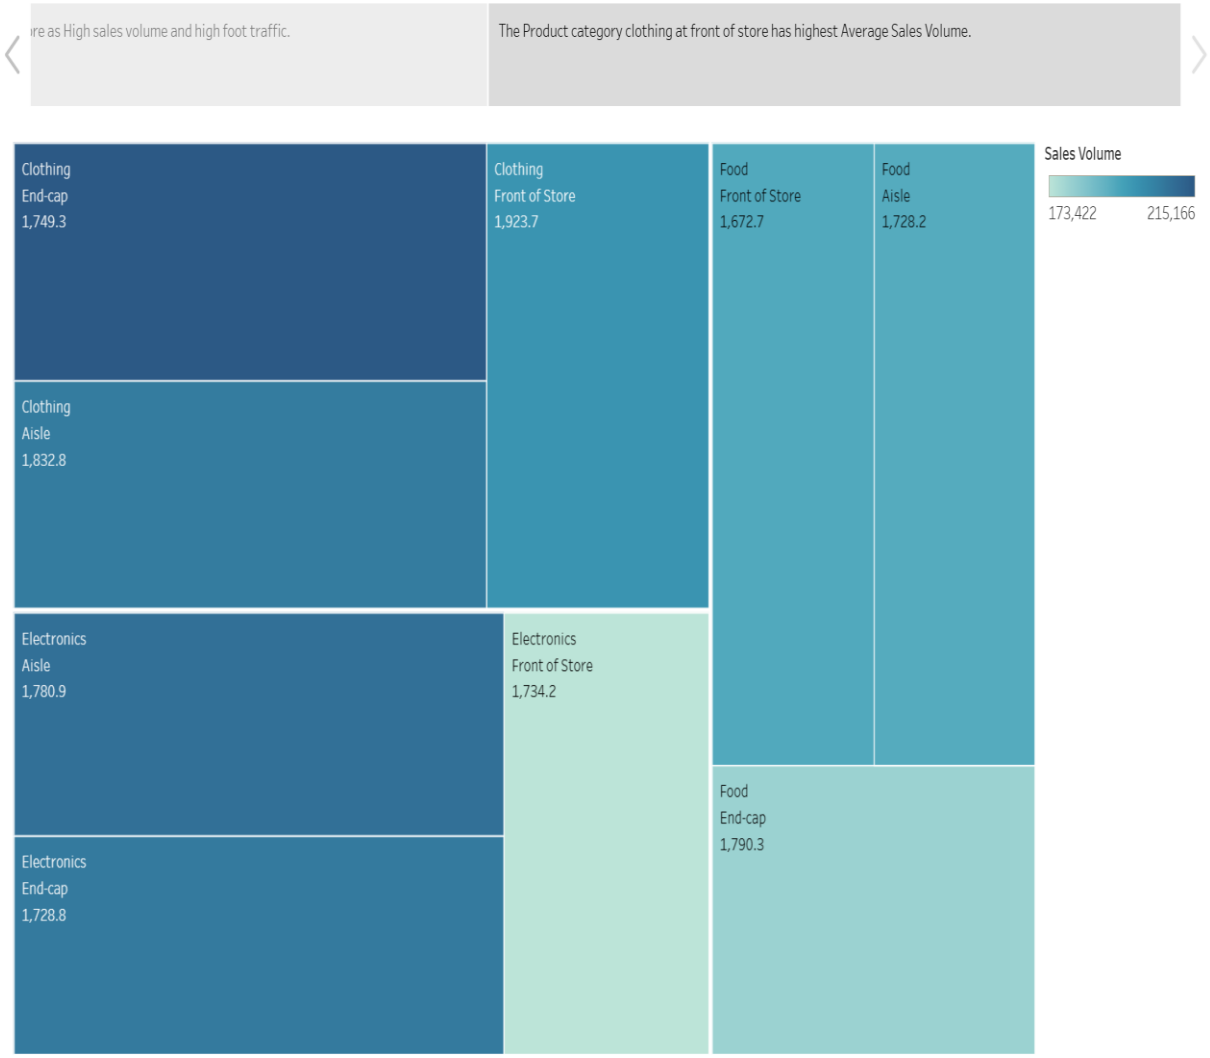
Each rectangle represents a combination of:

- Product Category
- Store Position

Key insights include:

- Clothing products placed at the front of the store recorded the highest sales volume (1923.7).
- Clothing products placed in aisles also perform strongly with sales around 1832.8.
- Electronics products show moderate sales across positions.
- Food products show comparatively lower sales performance.

The treemap clearly highlights that product placement significantly influences sales performance.



Placing high-demand products in prime store locations such as the front of the store increases sales potential.

10. Web Application Development Using Flask

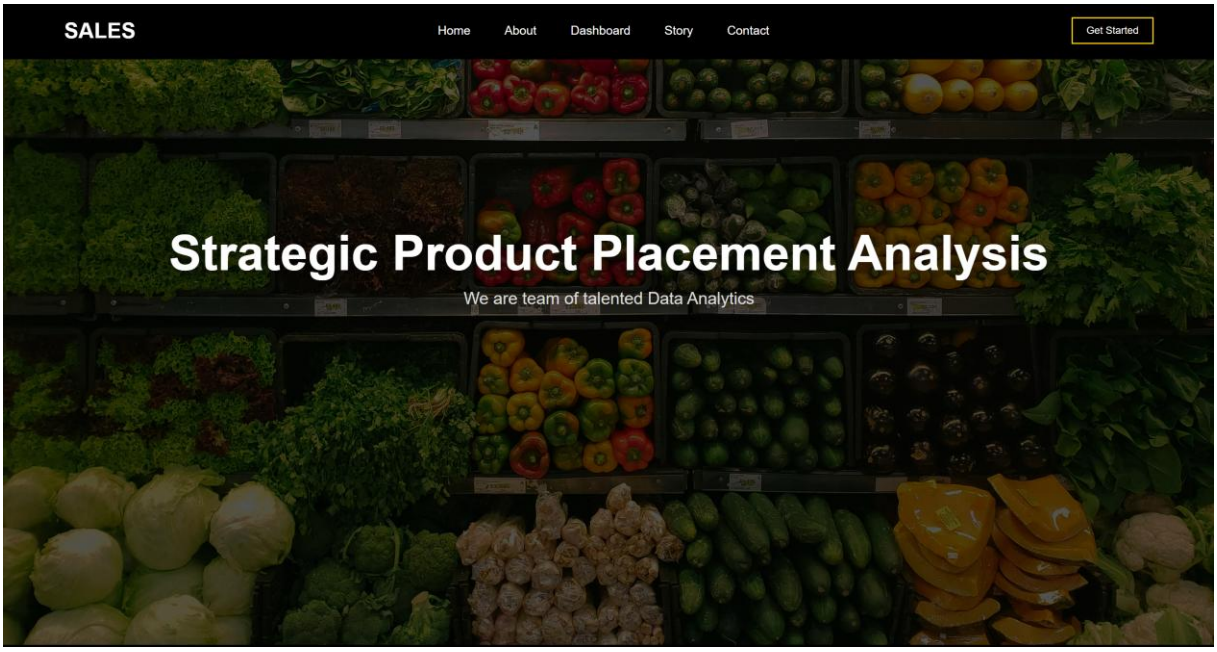
To make the dashboard accessible through a web interface, a Flask web application was developed.

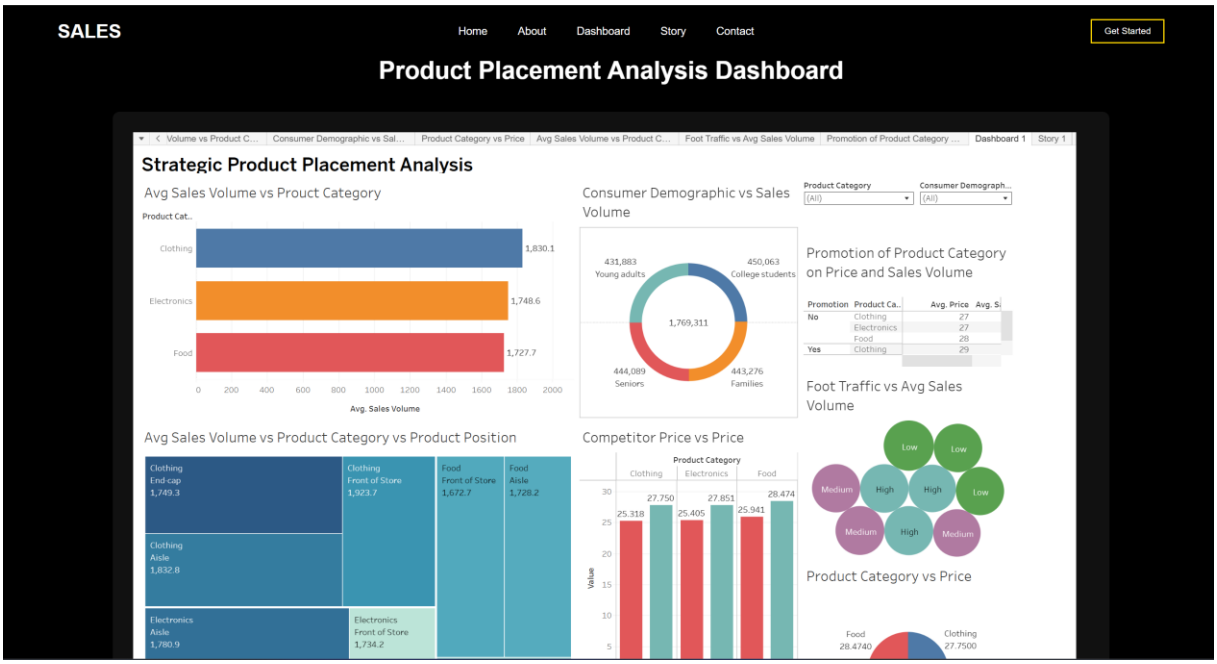
The web application contains the following sections:

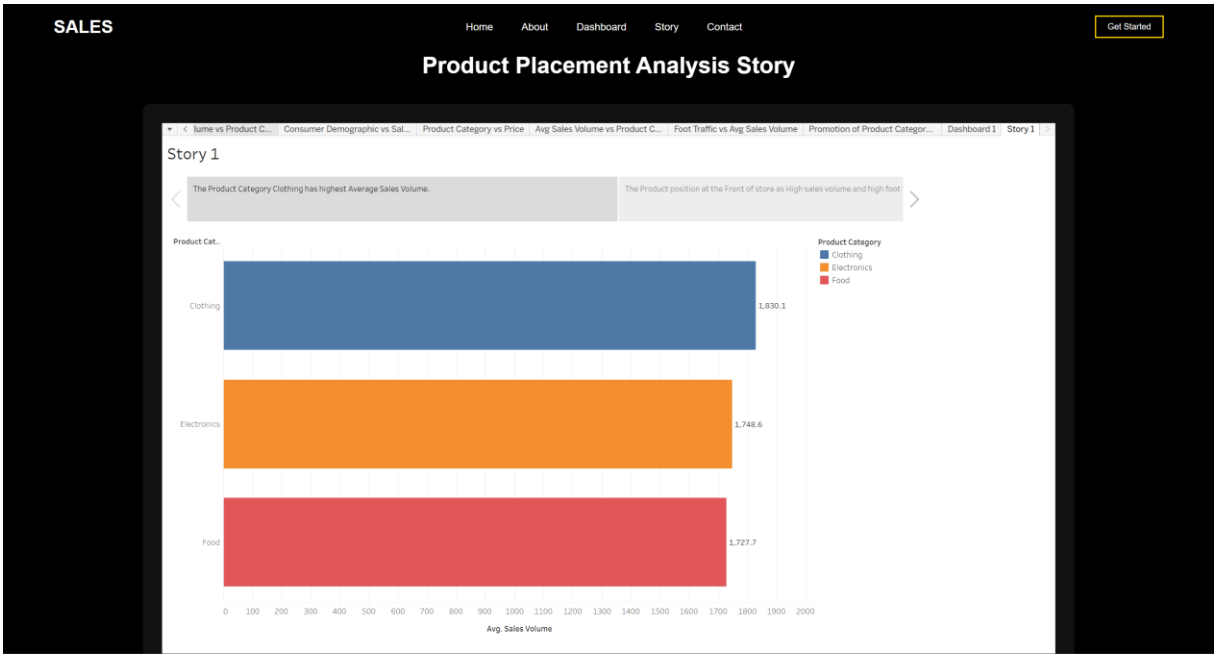
- Home Page
- About Section
- Tableau Dashboard Integration
- Tableau Story Integration
- Contact Page

The Tableau dashboard and story were embedded using Tableau Public embed code.

This allows users to interact with the analytics directly on the website.







11. Key Findings

1. From the Tableau Story analysis, the following conclusions were drawn:
2. Clothing is the highest performing product category.
3. Product placement significantly affects sales performance.
4. Front-of-store placement improves product visibility and customer engagement.
5. Foot traffic plays an important role in driving retail sales.

These insights can help retailers optimize store layout, product positioning, and marketing strategies.

12. Conclusion

This project demonstrates how data visualization and analytics can help retail businesses improve product placement strategies and increase sales performance.

Using Tableau dashboards and interactive storytelling, businesses can clearly understand:

- Customer purchasing behavior
- Product placement effectiveness

- Pricing competitiveness
- Promotional impact

The integration of analytics into a web application makes the insights easily accessible and interactive.

13. Future Enhancements

Future improvements for this project could include:

- Real-time retail sales data integration
- Machine learning models for sales prediction
- Customer behavior analysis
- Inventory optimization
- Mobile responsive dashboard interface
